

Phase 1 Testing Guide — User Management

✓ What Was Built

Phase 1 added **Admin User Management** with:

- 5 new user roles: **Admin, Manager, Team Lead, Sales, Field Marketer**
 - User status: **active** (can log in) or **paused** (blocked at login)
 - Profile fields: **phone** and **town** (added to database, ready for Phase 2)
 - Admin-only UI to add, edit roles, pause/unpause, and delete users
 - Auth gate now blocks paused users
-

🔧 Step 1: Run the Database Migration

The new schema needs to be applied to your local Postgres database. **You only need to do this once.**

Copy/Paste Command:

```
cd ~/flight-path-by-sunrite
docker exec -i flightpath-postgres psql -U flightpath -d flightpath < db/migrations/
001-extend-user-management.sql
```

What This Does:

- Adds `status` column to `app_users` (default: `active`)
- Adds `phone` and `town` columns for Phase 2 profiles
- Changes the `role` constraint from 2 roles (`member`, `admin`) to 5 roles
- Migrates your existing admin role: `admin` → `Admin` (capitalized)
- Creates indexes on `status` and `role` for fast queries

Expected Output:

```
BEGIN
ALTER TABLE
ALTER TABLE
ALTER TABLE
ALTER TABLE
UPDATE 1
CREATE INDEX
CREATE INDEX
COMMIT
```

If you see `ERROR: column "status" already exists`, it means you ran the migration before—that's fine, ignore it.

Step 2: Start the Web App

```
cd ~/flight-path-by-sunrite/web
npm run dev
```

The app should start at **http://localhost:3000**.

Step 3: Test User Management (Admin Portal)

3.1 Log In

1. Go to <http://localhost:3000>
2. Click **“Sign in with Google”**
3. Choose your **jrizzo@sunritesolarllc.com** account
4. You should be redirected to **/pages** (the library)

3.2 Open the Admin Portal

1. In the top-right nav, click **“Admin”**
2. You should see the admin dashboard with:
 - Stats (Total Pages, Hidden Pages, Last Sync)
 - **NEW: User Management section** (this is Phase 1!)

3.3 Test: View Users

- You should see a table with **at least 1 user** (yourself: `jrizzo@sunritesolarllc.com`)
- Columns: Email, Name, Role, Status, Actions
- Your role should be **Admin** and status **active**

3.4 Test: Add a New User

1. Click **“+ Add User”** button
2. Fill in:
 - **Email:** `testuser@sunritesolarllc.com` (or another `@sunritesolarllc.com` email)
 - **Role:** Choose **“Sales”** from the dropdown
3. Click **“Add User”**
4. The user should appear in the table with:
 - Email: `testuser@sunritesolarllc.com`
 - Role: **Sales**
 - Status: **active** (green badge)

3.5 Test: Change a User’s Role

1. Find the test user in the table
2. Click the **Role dropdown** (currently shows “Sales”)
3. Change it to **“Manager”**
4. The change should save immediately (watch for the dropdown to update)

3.6 Test: Pause a User

1. Click the **active** status badge (green) for the test user
2. It should change to **paused** (red badge)

3. Now log out and try to sign in as that user (if you have access to that email)
 - **Expected:** Login should be **denied** with a message about being paused

3.7 Test: Unpause a User

1. Click the **paused** badge again
2. It should change back to **active** (green)
3. The user can now log in again

3.8 Test: Delete a User

1. Click **"Delete"** in the Actions column for the test user
2. Confirm the deletion in the popup
3. The user should disappear from the table

3.9 Test: Try to Delete Yourself

1. Try clicking **"Delete"** on your own account (`jrizzo@sunritesolarllc.com`)
2. **Expected:** You should see an error: **"Cannot delete your own account"**

Step 4: Test Auth Gate (Paused Users Are Blocked)

1. Create a new test user and set their status to **paused**
2. Open an **incognito/private browser window**
3. Go to `http://localhost:3000`
4. Try to sign in with that paused user's email
5. **Expected:** You should be **redirected back to the login page** (no access)

Check the terminal where `npm run dev` is running. You should see:

```
[auth] login denied (user_paused) testuser@sunritesolarllc.com
```

Acceptance Checklist

- ☐ Database migration ran successfully
- ☐ Admin portal shows the User Management section
- ☐ I can see the list of users (including myself)
- ☐ I can add a new user with a specific role
- ☐ I can change a user's role via the dropdown
- ☐ I can pause a user (status changes to red badge)
- ☐ Paused users cannot log in (tested in incognito)
- ☐ I can unpause a user (status changes back to green)
- ☐ I can delete a user
- ☐ I cannot delete my own account (error shows)

If Something Goes Wrong

Error: “Invalid role”

- Make sure you ran the migration. The database still has the old 2-role constraint.

Error: “Unauthorized: Admin role required”

- Your role in the database is still `admin` (lowercase). The migration should have fixed this.
- Manual fix:

```
sql
docker exec -it flightpath-postgres psql -U flightpath -d flightpath -c "UPDATE app_users
SET role = 'Admin' WHERE lower(role) = 'admin';"
```

Can't see the User Management section

- Make sure you're logged in as an **Admin** (not another role)
- Check the browser console for errors (press F12)

“Failed to fetch users” error

- Check that the database is running:

```
bash
docker ps | grep postgres
```

- Check the terminal running `npm run dev` for database connection errors
-

Next Steps

Once Phase 1 is tested and working, we have two options:

1. Proceed to Phase 2: User Profiles

- Add profile page where users edit their photo, phone, email, town
- Estimated time: 1-2 hours

2. Proceed to Phase 3: AI Chat with Notion MCP

- Add chat page with read-only access to Notion content
- Requires: Notion integration token, OpenAI API key (or z.ai endpoint)
- Estimated time: 2-3 hours

Let me know which you'd like to tackle next, or if you'd like to pause and test Phase 1 thoroughly first!
