

Flight Path is READY TO TEST!

Your App is Live

Public URL: <https://14f6d652c.na121.preview.abacusai.app>

- ✓ Database running (PostgreSQL 15)
 - ✓ Phase 1 migration applied
 - ✓ Next.js dev server running
 - ✓ Google OAuth credentials configured
 - ✓ All TypeScript checks passing
-

ONE FINAL STEP: Configure Google OAuth Redirect URI

Your Google OAuth credentials are configured in the app, but you need to **add the redirect URI** to your Google Cloud Console:

Quick Fix (2 minutes):

1. Go to: <https://console.cloud.google.com/apis/credentials>
 2. Find your OAuth 2.0 Client ID: `1007966664828-5ic5tvdqv09q8sricuud7f2gsr6fl85v`
 3. Click “Edit” (pencil icon)
 4. Under **“Authorized redirect URIs”**, add this URL:
`https://14f6d652c.na121.preview.abacusai.app/api/auth/callback/google`
 5. Click **Save**
 6. Wait 1-2 minutes for Google to propagate the changes
-

Testing the App

Step 1: Visit the App

Open in YOUR browser (not the Abacus AI Agent browser):

👉 <https://14f6d652c.na121.preview.abacusai.app>

Step 2: Sign In

1. Click **“Sign in with Google”**
2. Select your Google account: `jrizzo@sunritesolarllc.com`
3. Grant permissions
4. You should be redirected to the app (landing page)

Step 3: Access Admin Panel

1. Navigate to: <https://14f6d652c.na121.preview.abacusai.app/admin>

2. You should see the admin dashboard with:

- ☒ Stats cards (Total Users, Active Users, etc.)
- ☒ **User Management Section** (Phase 1!)

Step 4: Test User Management Features

Add a New User:

1. Scroll to “User Management” section
2. Enter email: `test@sunritesolarllc.com`
3. Select role: “Sales” or “Field Marketer”
4. Click “Add User”
5. ☒ New user appears in the table

Change a User’s Role:

1. Find the test user in the table
2. Click the role dropdown
3. Select a different role (e.g., “Team Lead”)
4. ☒ Role updates immediately

Pause a User:

1. Click the green “Active” badge next to a user
2. It changes to red “Paused”
3. ☒ That user cannot log in now (try signing in with that account)

Reactivate a User:

1. Click the red “Paused” badge
2. It changes back to green “Active”
3. ☒ User can log in again

Delete a User:

1. Click the 🗑 delete icon
2. Confirm the deletion
3. ☒ User disappears from the table
4. Try deleting your own account → ❌ Should show error “Cannot delete your own account”

What to Verify

Phase 1 Features (User Management):

- [] Can add users with all 5 role options (Admin, Manager, Team Lead, Sales, Field Marketer)
- [] Can change user roles via dropdown
- [] Can pause/unpause users (status toggle works)
- [] Paused users cannot log in (test with a paused account)
- [] Can delete users (except yourself)
- [] User table updates immediately after changes
- [] All users must have @sunritesolarllc.com email (domain gate enforcement)

Design System (Sunrite OS):

- [] Dark backgrounds (#060607)
- [] Orange accent color (#E8472A) on buttons/badges

- [] White text with opacity variants
- [] JetBrains Mono font for code/data
- [] Smooth transitions and grain texture overlay

Database Check

Your admin account was migrated:

```
Email: jrizzo@sunritesolarllc.com
Role: Admin (capitalized)
Status: active
```

To verify the database directly (from Abacus AI Agent), run:

```
PGPASSWORD='xutUSdG/z8FFFeHE9DvvEnLMK+UNablTZm7pRh7/cuY=' psql -h localhost -U flight-
path -d flightpath -c "SELECT email, role, status FROM app_users;"
```

Troubleshooting

“Error 400: redirect_uri_mismatch”

- **Cause:** Redirect URI not added to Google Cloud Console
- **Fix:** Follow the “Configure Google OAuth Redirect URI” steps above

“Unauthorized” or “Admin role required”

- **Cause:** Not logged in, or logged in as non-admin
- **Fix:** Sign in with jrizzo@sunritesolarllc.com (the only admin user)

App won’t load

- **Cause:** Dev server stopped
- **Fix:** Let me know and I’ll restart it

“Email domain not allowed”

- **Cause:** Trying to sign in with non-@sunritesolarllc.com email
- **Fix:** Only sunritesolarllc.com emails are allowed (domain gate)
- To add more domains, I can help you update the `allowed_domains` table

Next Steps After Testing

Once you’ve verified Phase 1 works, choose what’s next:

1. Phase 2: User Profiles

- Photo upload with avatar display
- Phone number editor

- Town/location selector
- User profile page

2. **Phase 3: AI Chat with Notion MCP**

- Read-only Notion integration
- Chat interface with source citations
- Admin controls for system prompt
- OpenAI-compatible API (z.ai)

3. **Bug Fixes / Refinements**

- If anything doesn't work as expected during testing

Important Notes

- **This localhost refers to the Abacus AI Agent VM**, not your local computer
- The app is temporarily hosted here for testing
- The VM will shut down after inactivity (your data is saved)
- To run this on your Mac later, you'll download the files and run them locally
- All code is version controlled with Git 

Ready to test! Let me know how it goes.
